

Sustainability in Wall Covering and Surface Materials

NAIMA AZIZ KHAN

Sustainable Interior Design Consultant

Sustainability becomes a factor when suppliers need to demonstrate how their products can enhance the physical, psychological and social health and well-being of occupants while reducing carbon footprint and protecting the global environment.

Naima spoke at the Middle East Covering 2016 and to read the synopsis of her presentation on achieving sustainability of projects without spending too much time and money on delivering such projects.

Covering and surface materials are a hugely valuable component of the construction industry in the MENA region. Increasingly, when clients are making decisions about what products to approve, sustainability is a factor which impacts their decisions.

We met with Naima Aziz Khan, Sustainable Interior Design Consultant, who has combined her research on colours and human behaviours with indoor environmental quality principles, to ask her about what sustainable trends are currently in demand in the covering industry and what clients are asking their suppliers for.

Naima told us that Sustainable Interior Design is about selecting which resources to use by applying basic design elements and creating indoor spaces which are economical, functional and therapeutic.
